Project Description

“The Traveler”

Chatbot Name: **MindReader**

Domain: Travel

Page services: Recommends what is perfect according to user’s preferences; i.e: It filters travelers’ choices of city and residence, as well as allowing the users to rate both suggestions.

Chatbot requirements:

1. Greeting: greet the user according to the current time (morning/noon/night).
2. Rate a previously-suggested city.
3. Rate a previously-suggested residence.

4. Recommend a city/cities to visit after receiving the **user's current country**, **type of trip** (single or multiple destinations), **type of travel** (domestic or foreign).
5. Recommend a place for residence after receiving the **maximum budget** for "residence costs", **number of travelers**, **number of days**.
6. Usability; easy to use, ex: mostly offering multiple choices for the user rather than asking them to typing each information.
7. Availability; the bot is available 24 hours and during pressure of loaded requests.
8. Performance; not more than 3 seconds.

Expected scenarios:

1. Once the user enters the chatbot, a message is popped up:
"Goodmorning/Good afternoon/Goodevening! I am MindReader, how can I help you?"
2. The user chooses "Rate a previously-suggested city.", display all previously-suggested cities to let the user choose one of them to be rated.
3. The user chooses "suggest me a new trip!", a few questions are asked to know **user's current country**, **type of trip**, **type of travel**. Once the user answers all the questions a city or a few cities.
